Setting up WIFI on Non-SPS Devices

Connecting to SPSDWIRELESS involves going into the settings of the device and attaching it to the network, then “authenticating” through a web browser.

Obviously, there are too many devices to document, but generally, there are a series of steps that should work on most devices.

On a mobile device, the WIFI settings are usually located in the “Settings” section. “Settings” are usually represented by a gear or sprocket type icon like on the iDevices:

or Android devices:
Once in the “Settings” screen, there should be a “WIFI” section like on iDevices:

or Android devices:

WIFI must be turned on by selecting the WIFI selection.
At that point, all WIFI networks in range will be visible. The network need for guest access in Saskatoon Public is SPSDWIRELESS:

On a PC, the wireless settings are shown in the bottom right corner on the little “stairs” or “bars” type icon:

![PC Wi-Fi Settings](image)
or in the top right on an Apple machine with a "broadcast" type icon:

A red X would indicate that the wireless receiver is not turned on, which is often a button or switch on the device:

Once connected to the network, an Internet browser (for example, Internet Explorer, Safari, Firefox, Chrome or simply "Internet" on Android devices) needs to be opened in order to authenticate. This applies to all devices:

Users must enter their username and password in order to proceed with wireless access. Once this step is done, the user should have full Internet access.
